

DDA6010/CIE6010 · Assignment 3

Due: 23:59, October 20

Instructions:

- Assignment problems must be carefully and clearly answered to receive full credit. Complete sentences that establish a clear logical progression are highly recommended.
- You must submit your assignment in Blackboard. Please upload a pdf file with codes. The file name should be in the format **last name-first name-student ID-hw1**, e.g. **Zhang-San-123456789-hw1**.
- Please make your solutions legible and write your solutions in English. You are strongly encouraged to type your solutions in L<sup>A</sup>T<sub>E</sub>X/Markdown or others.
- Late submission will **not** be graded.
- Each student **must not copy** assignment solutions from another student or from any other source.
- For those questions that ask you to write MATLAB/Python/other codes to solve the problem. Please attach your code in the **pdf file**. You also need to clearly state (write or type) the optimal solution and the optimal value you obtained. However, you do not need to attach the outputs in the command window of MATLAB/Python/others.

Problem 1 Convex Sets (25pts).

(a) Verify whether the following sets are convex or not and explain your answer:

$$X_1 = \{(\mathbf{x}, t) \in \mathbb{R}^n \times \mathbb{R} : \mathbf{x}^\top \mathbf{x} \leq t^2\}$$
$$X_2 = \{\mathbf{x} \in \mathbb{R}^n : (\mathbf{a}^\top \mathbf{x})^2 \leq \alpha\}, \mathbf{a} \in \mathbb{R}^n, \alpha \geq 0$$

(b) Prove that

$$\text{conv}\{e_1, e_2, -e_1, -e_2\} = \{x \in \mathbb{R}^2 : |x_1| + |x_2| \leq 1\},$$

where  $e_1 = (1, 0)^T, e_2 = (0, 1)^T$ .

(c) Show that the conic hull of the set:

$$S = \{(x_1, x_2) : (x_1 - 1)^2 + x_2^2 = 1\}.$$

is the set

$$\{(x_1, x_2) : x_1 > 0\} \cup \{(0, 0)\}.$$

**Remark:** This is an example illustrating the fact that the conic hull of a closed set is not necessarily a closed set.

- (d) Let  $S$  be a convex set. Prove that  $x \in S$  is an extreme point of  $S$  if and only if  $S \setminus \{x\}$  is convex.

**Problem 2 Convex and Concave Functions (25pts).**

- (a) Let  $C \subseteq \mathbb{R}^n$  be a nonempty set. The support function of  $C$  is the function  $\sigma_C : \mathbb{R}^n \rightarrow (-\infty, \infty]$  given by

$$\sigma_C(\mathbf{y}) = \max_{\mathbf{x} \in C} \mathbf{y}^\top \mathbf{x}.$$

Show that  $\sigma_C$  is a closed and convex function.

- (b) Let  $f : \mathbb{R}^n \times \mathbb{R}^m \rightarrow \mathbb{R}$  and  $C \subseteq \mathbb{R}^m$  ( $C \neq \emptyset$ ) be given and assume that  $f(\cdot, \mathbf{y}) : \mathbb{R}^n \rightarrow \mathbb{R}$  is convex for every fixed (but arbitrary)  $\mathbf{y} \in C$ . Show that the mapping  $g : \mathbb{R}^n \rightarrow (-\infty, \infty]$ ,  $g(\mathbf{x}) = \sup_{\mathbf{y} \in C} f(\mathbf{x}, \mathbf{y})$  is convex.
- (c) Let  $f : \mathbb{R}^n \times \mathbb{R}^m \rightarrow \mathbb{R}$  be  $L$ -smooth and  $f(\mathbf{x}, \cdot)$  be  $\mu$ -strongly concave (for an arbitrary but fixed  $\mathbf{x}$ ). Suppose the constraint set  $C \subseteq \mathbb{R}^m$  ( $C \neq \emptyset$ ) is a convex and bounded set. Prove that the function  $\mathbf{y}^*(\cdot) = \arg \max_{\mathbf{y} \in C} f(\cdot, \mathbf{y})$  is  $\kappa$ -Lipschitz, where  $\kappa := L/\mu$ . (Hint: You may refer to [1, Lemma 4.3].)

**Problem 3 Log-Convexity (25pts).**

Assume that  $f : \mathbb{R}^n \rightarrow (0, \infty)$  is a positive-valued function. Show that  $(a) \Rightarrow (b) \Rightarrow (c)$  and provide counterexamples to show that the converse implication is not true:

- (a)  $1/f$  is concave
- (b)  $\log(f)$  is convex
- (c)  $f$  is convex.

Hint: The generalized Arithmetic-Geometric inequality says that  $\forall x, y, a, b \geq 0$  with  $a + b = 1$  it holds that  $ax + by \geq x^a y^b$ .

**Problem 4 Optimality Conditions for Convex Problems (25pts).**

We consider the convex optimization problem

$$\min_{\mathbf{x} \in X} f(\mathbf{x}) + \varphi(\mathbf{x}), \tag{1}$$

where  $X \subseteq \mathbb{R}^n$  is a nonempty, convex set and  $f : X \rightarrow \mathbb{R}$ ,  $\varphi : X \rightarrow \mathbb{R}$  are given convex functions. Furthermore, let  $\mathbf{x}^* \in X$  be a feasible point and suppose that the mapping  $f$  is continuously differentiable in an open neighborhood  $U$  containing the convex set  $X$ . Show that  $\mathbf{x}^*$  is a global solution of the Problem (1) if and only if the following optimality condition is satisfied:

$$\mathbf{x}^* \in X, \text{ and } \nabla f(\mathbf{x}^*)^\top (\mathbf{x} - \mathbf{x}^*) + \varphi(\mathbf{x}) - \varphi(\mathbf{x}^*) \geq 0, \forall \mathbf{x} \in X.$$
